AGENTICS DAY: MCP + AGENTS · KubeCon NA 2026

From alert to pull request in *minutes*

Wiring NeuBird and GitHub Copilot via MCP

Grant Griffiths
Founding Engineer, NeuBird AI

AGENDA

What we'll *cover*

1	**The 2am page**	Why incident response is still a manual race against the clock
2	**Agents, wired together**	A production ops agent and a coding agent, connected with MCP
3	**Live demo**	From a traffic surge to a merged pull request on PelicanPay
4	**Putting it into practice**	What to take back to your own platform

THE MOTIVATION

The 2am *page*

Escalations, outages, and on calls

An alert fires. An on-call engineer spends hours correlating signals across observability tools, drafts a quick fix under pressure, and hopes it clears review before the SLA clock runs out.

And it's not just downtime. It's lost revenue, SLA penalties, and disruption that cascades across every dependent service.

$400B

lost to downtime each year across the world's 2,000 largest companies

Splunk & Oxford Economics, 2024

$2M

median cost per hour of a high-impact IT outage

New Relic Observability Forecast, 2025

$76M

median yearly cost of high-impact IT outages per organization

New Relic Observability Forecast, 2025

THE MOTIVATION

A manual race against the *clock*

1

On-call alert

Alert fires. On-call engineer paged. Incident response initiated.

2

Hours to analysis

Manually correlate signals across observability tools.

3

Under pressure fix

Engineer drafts a fix solo, racing the clock.

4

Hope

Submit for review and hope it clears before the SLA deadline.

Elapsed time: hours, under pressure, with no guarantee of a clean audit trail

THE GOAL

An automated pipeline, agents working *for you*

PRODUCTION OPS AGENT

NeuBird

- Watches alerts as they fire
- Correlates telemetry across observability tools
- Produces a root-cause analysis with evidence, before a human opens a dashboard

MCP

COPILOT CLOUD AGENT

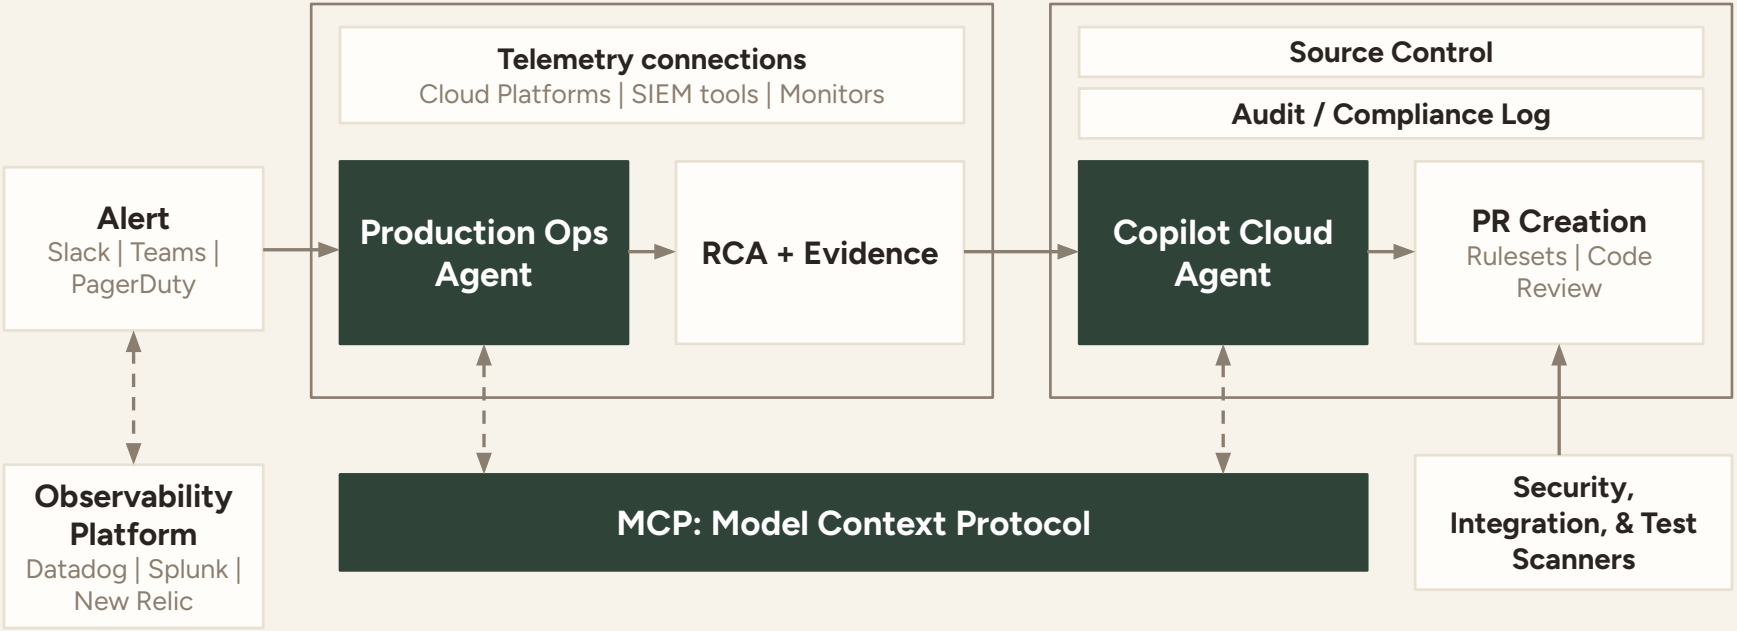

GitHub

- Takes the RCA as context
- Drives a targeted code fix
- Runs it through security scans and test pipelines
- Opens the PR, starting the standard SDLC and agentic code review

MCP hands the root cause from one agent to the other, with no copy-paste in between.

THE GOAL

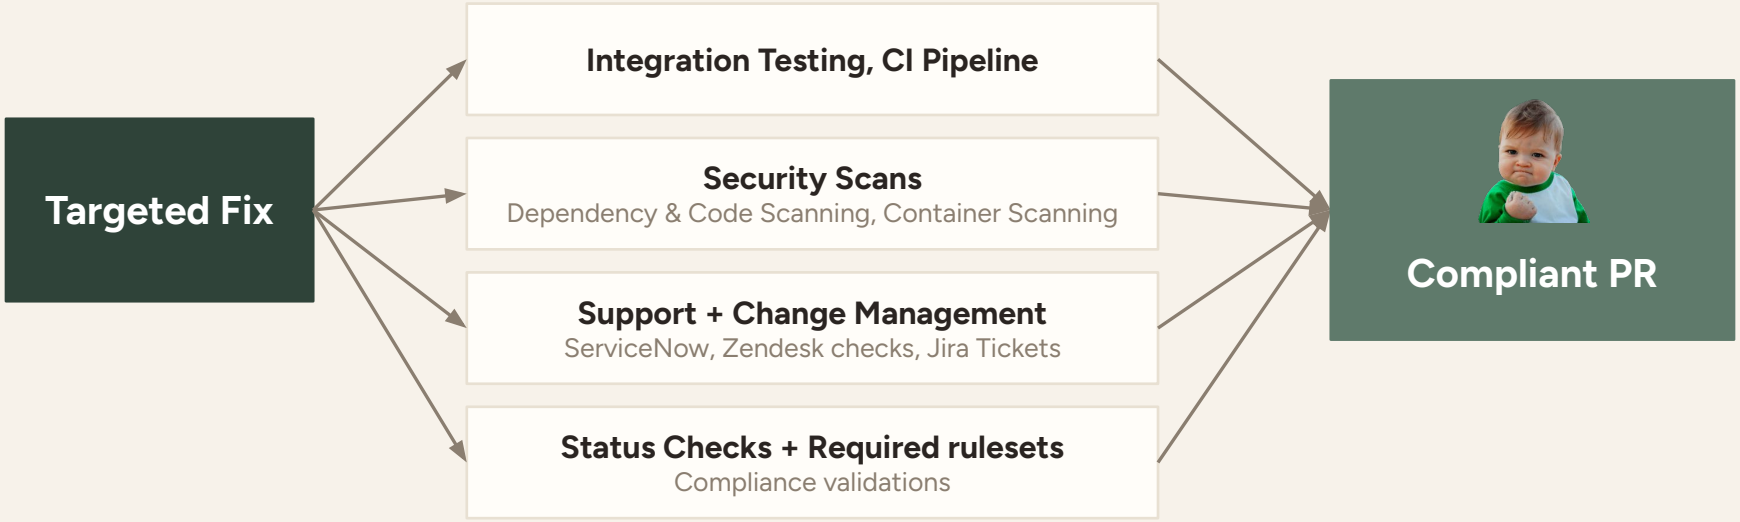

Blueprint for the *orchestration*

Dark green: updated agentic capabilities to the flow

THE GOAL

Consistent standards: The same gates, every *time*

Gates run automatically and in parallel. Speed never means skipping a scan.

AGENTICS DAY · LIVE DEMO

From alert to pull request in *minutes*

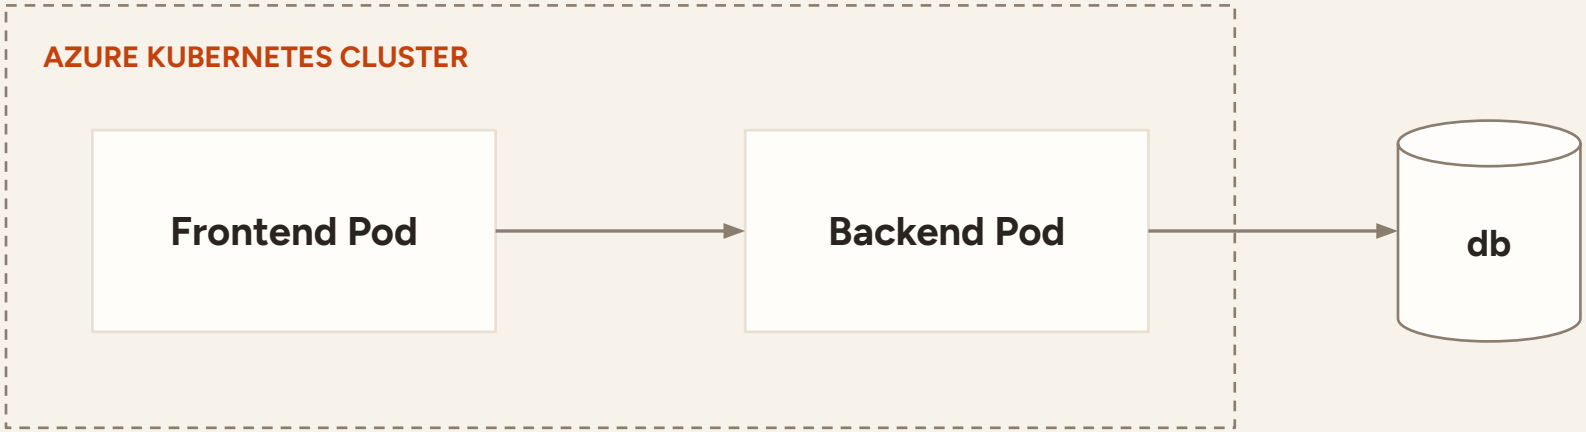

Wiring NeuBird and GitHub Copilot via MCP, on a real payments app

1. **Demo site traffic surges**
2. **Alert fires**
3. **NeuBird investigates**
4. **Copilot takes the issue**
5. **You review and merge**

Grant Griffiths · Founding Engineer, NeuBird AI

THE DEMO APP

PelicanPay *Demo*

THE DEMO

PelicanPay's incident response *flow*

DETECT AND INVESTIGATE

Azure Monitor alert → **Slack alert** via webhook → **NeuBird analysis** Azure Monitor, AKS logs, GitHub audit → **RCA + fix recommendation** in minutes

FIX AND SHIP

Remediation → **Skill calls MCP** Opens an issue with the RCA, assigns Copilot → **Copilot Cloud Agent** Writes the fix, opens the PR → **PR flow** Agentic review, required rulesets, human approver or automerge

AUDIT TRAIL GitHub audit log, PR comments, Actions and Copilot session data, git history

Dark green: agentic steps

THE RESULT

What's in the PR: built for *audit*

✓	**RCA narrative + supporting evidence**	Logs, metrics, and traces, not just a one-line summary.
✓	**Linked alert & incident timeline**	The full chain from page to PR, preserved automatically.
✓	**A diff scoped to the root cause**	A targeted change driven by evidence, not a guess made under pressure.
✓	**Security & test results, attached**	Pass/fail status inline, nothing to chase down later.
✓	**A reviewer-ready summary**	Audit trail by default, not bolted on after the fact.

KEY TAKEAWAYS

Putting it into *practice*

01

Treat incident response as a pipeline, not a hero effort

Wire agents together with MCP so context (alerts, code, evidence) flows automatically.

02

Let the RCA drive the fix

A targeted, evidence-backed change beats a guess made under pressure.

03

Keep every existing security and compliance gate in the loop

Speed should never mean skipping a scan.

04

Auditability is a byproduct of the architecture

Not an afterthought bolted on after the incident is closed.

TAKEAWAYS

MCP connects NeuBird's root cause to Copilot's *fix*

NEUBIRD INVESTIGATES

- Queries your monitoring
- Finds the root cause
- Writes the RCA report

MCP CONNECTS THEM

- NeuBird's MCP server
- Copilot reads the RCA
- Any MCP client works

COPILOT FIXES IT

- Writes the fix
- Opens a PR with a test
- You review and merge

CONNECT NEUBIRD TO COPILOT
